#
# --------------------------------------------------------------------------
#
# A syllable is always coded with a C-V sequence.
# The vowel is represented by a position on the face, and the consonant
# by an hand key.
#
# Example of use:
# The word "Bonjour" is phonetized /b-O~-j-u-R/
# It is syllabified /b-O~.j-u.R/ then converted to keys:
#    /b-O~/ = 4-4
#    /j-u/ = 7-2
#    /R/ = 8-0
# The first key always refers to a consonant and the second to a vowel.
#
# --------------------------------------------------------------------------
# By convention in this configuration file:
#
# - cnil substitutes a missing consonant.
#   It will be used when there's no consonant before the vowel.
#
# - vnil substitutes a missing vowel.
#   It will be used when there's no vowel after a consonant.
# --------------------------------------------------------------------------

# --------------------------------------------------------------------------
# Here is the list of phonemes and their class.
# --------------------------------------------------------------------------
# A phoneme/class definition is made as 3 columns:
#        - first column is the key-word "PHONCLASS";
#        - second column is the phoneme;
#        - third column is the class-symbol.
#
# It is important to note that:
#        - a vowel has to be mentioned with the class-symbol "V";
#        - a consonant has to be mentioned with the class-symbol "C";
#        - the class-symbol for a break is "#".

# The filled pause is not coded, it is considered a break.
```
